3. BLOCK DIAGRAM

4. CPU (MSM6283-07GS)

- Generates pitch and envelope signals for melody, chord, bass, and obbligato sounds.
- Provides percussio sounds.
- Controls keys, switches, RAM, and ROM.

The following lists the pin functions of the CPU.
As the LSI works in negative logic, GND is +5 V whereas power source is 0 V.

Pin No.	Terminal Name	In/Out	Function
1	BGND		+5 V source for ADC (Analog to Digital Converter)
2	VADC		Ground (0V) source for internal ADC
3,4			Not used
5~ 11	IO0~ IO6	In/Out	Data bus (IO0~ IC5)
12	A0	Out	Address bus (A0)
13	IO7	In/Out	Data bus (IO7)
14	A1	Out	Address bus (A1)
15	\overline{CE}	Out	Chip enable signal for memory devices. Low active
16~ 18	A2, A10, A3	Out	Address bus (A2, A3, A10)
19	\overline{OE}	Out	Output enable signal for RAM. Low active
20~ 30	A4~ 9, A11~ 15	Out	Address bus (A4~ 9, A11~ A15)
31	\overline{WE}	Out	Write Enable signal. CPU writes data into memory devices when "Low"
32	\overline{RFSH}	Out	Refresh signal output CPU refreshes RAM memory data when "Low"
33~ 39			No function
40	GND		+5 V source
41,42			No function
43	VDD1		0V source
44~ 56			No function
57,58	OSI, OSO	In/Out	7.277088 MHz clock pulse input and output
59	MI	In	Not used
60	RESET	In	Reset signal input Terminal receives "High" level pulse initializing CPU internal circuits at power ON
61~ 63			No function
64	KO12	Out	APO (Auto Power Off) signal output Terminal rises to High level to shut voltages off when the unit is not operated for approximately 7 minutes.
65			No function
66~ 76	KO10~ KO0	Out	Key and switch common signals outputs
77~ 84	K11~ K18	In	Key and switch input signals
85~ 88			No function
89~ 92	EH~ EE (4~ 1 ch)	Out	Melody envelope signals outputs
93~ 96	SH~ SE (4~ 1 ch)	Out	Melody pitch signals outputs

Pin No.	Terminal Name	In/Out	Function
97	SC	Out	Percussion signal output
98	AGND		+5V source for DAC (Digital to Analog Converter)
99	VDAC		0V source for DAC
100	Vin	In	Sampling sound signal input from built-in MIC

CPU, RAM and ROM control time chart

5. PITCH/ENVELOPE MIXING CIRCUIT

CPU outputs four each of pitch and envelope signals.

Normally all the signals are for melody sounds however, when the demonstration music is played, each pitch and envelope signals become obligato, bass, chord, or melody sounds.

CA91A02 contains four mixers and merges each pitch and envelope signals.

6. SAMPLING CIRCUIT

Fig. 1 Sample Sound Input Circuit

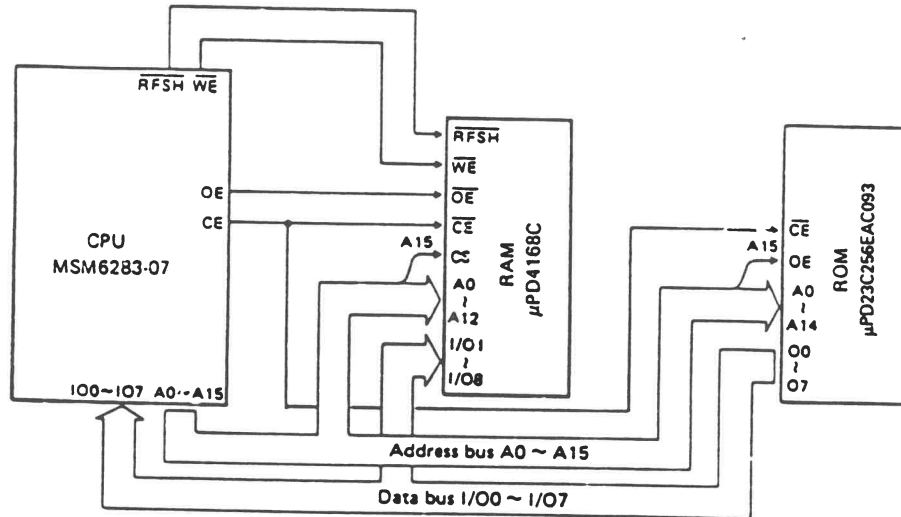

Fig. 2 VIM Input Trigger Level

As shown in Fig. 1, the circuit provides sampling signals to the VIM terminal of the CPU. Resistors 100 K ohm and (100 + 4.7) K ohm bias the sampling signal on 2.557 V. When the sampling sound level exceeds ± 0.315 V as shown in Fig. 2, the CPU starts to transmit the sampling sound data to the RAMs. While sampling, the CPU transmits the sampling sound data to the sampling RAMs directly. While sampling, CPU does not output key common signals (KO0- KO10) so that the keyboard becomes inoperative. Sampled sounds are digitized in CPU and transmitted to the RAM.

7. ROM & RAM ACCESSES

The RAM is 64 Kbit dynamic RAM. Since they are dynamic type, data must be refreshed every 2 milliseconds at least. The memory is used as the demonstration, memory play and sampling data area.

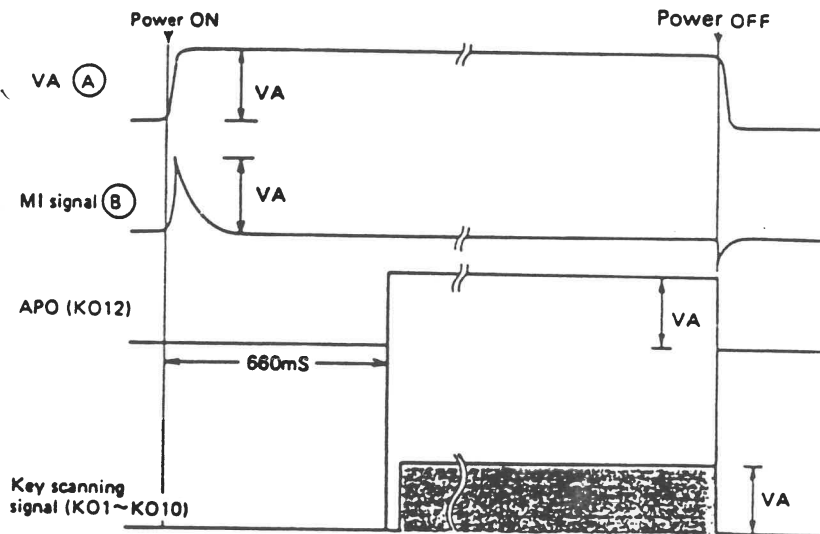

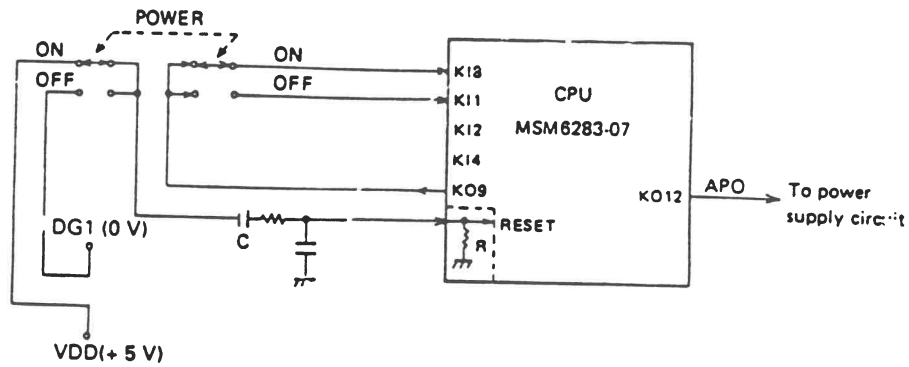

The capacity of ROM is 256 Kbit and it contains the program for system execution and the preset tone data.

The chip select conditions are as shown below.

Signal Chip	A15	\overline{CE}	\overline{OE}	\overline{WE}
RAM	L	L	L	L
ROM	H	L	X	X

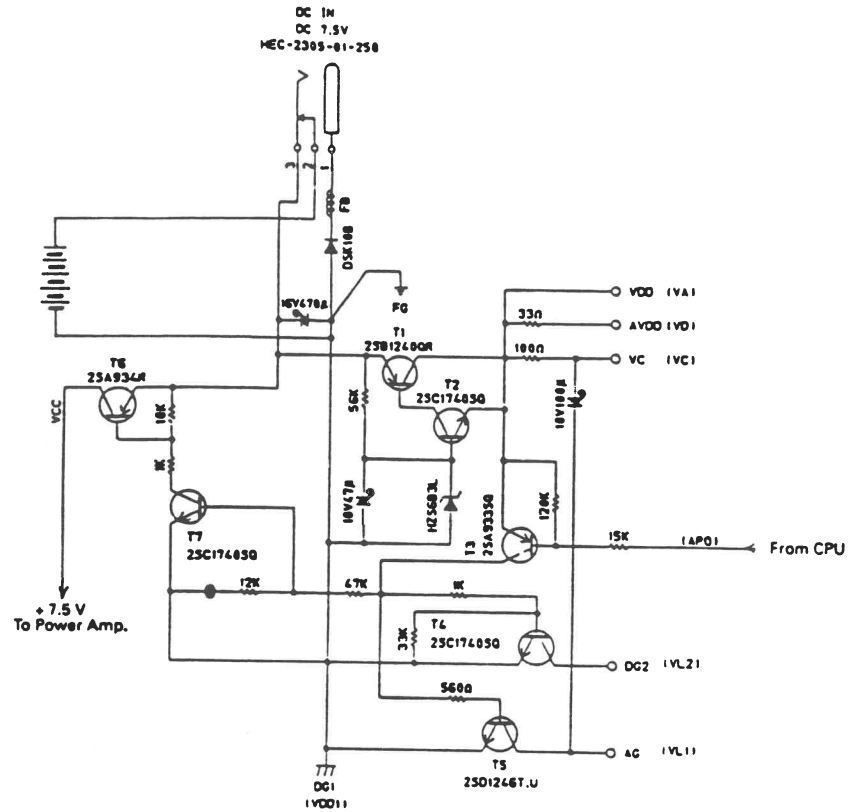

H: High level
L: Low level
X: Irrelevant

8. RESET CIRCUIT

At power ON, the CPU receives RESET signal as shown in the time chart by a differential circuit of capacitor C and resistor R. Then the CPU outputs APO (K012) and key scanning signals, and starts controlling of peripheral circuits. Also, the CPU detects power switch OFF by receiving key common signal (K09) in key input terminal (K18) and stops functioning.

9. POWER CIRCUIT

The Power Circuit provides VDD (+ 5 V for digital circuits), AVDD (+ 5 V for linear circuits), VC (+ 5 V for sampling circuits) and, VCC (+7.5 V for Power Amp.)

Transistors T1, T2 and, zener diode HZ6B regulates the power voltage in + 5 V for VDD, AVDD, and VC. Normally, CPU drops the signal APO Low causing transistors T3 - T7 on. Grounds AG and DG2 and, VCC (+ 7.5 V for Power Amp.) are supplied to the circuits.

When the keyboard is left unoperated for six minutes, signal APO becomes High level. Transistors T3 - T7 are turned off causing VCC, DG2, and, AG shut off.

10. TROUBLESHOOTING

Trouble	Faulty Block	Cause/Treatment
No power	Power supply circuit	Check voltages in accordance with the schematic diagram
	Power switch	Switch contacts and switch spring tension (Check waveform ②)
	CPU	Check waveform ⑩
	Pulse generator	Check waveform ①
No sound at all	Power circuit	Check voltages VH (7.5V), VL1 (0V)
	CPU	Check waveforms ③ ~ ⑦
	ROM	
	Mixing Amp.	Check emitter signal of transistor T11
	Power Amp.	Check output signal (pin 2) of Power Amp.
	Speaker	
No melody sound at all (Percussions sound OK)	Pitch/Envelope mixing circuit	Check waveforms ③ ~ ⑥
	ROM	
No rhythm sound at all (Melody sound OK)	CPU	Poor soldering of CPU (Check waveform ⑦)
	ROM	
Certain keys or switches do not respond	Dirty contact	Clean PCB CN1M and contact rubbers
	Poor soldering of diodes	Resolder diodes
	Poor contact of PC joiner	Check poor contact PC joiners
	CPU	Check poor soldering of CPU
Sampling impossible	Built-in MIC	
	Sampling circuit	Check collector signals of transistors T28 and T29
	CPU	
	RAM	
Distorted sound	Battery	Check the battery voltage
	Speaker	
	Power Amp.	Check output signal (pin 2) of Power Amp.
	Mixing Amp.	Check emitter signal of transistor T11

PARTS LIST

SK-2

- Notes:**
1. Prices and specifications are subject to change without prior notice.
 2. As for spare parts order and supply, refer to the "GUIDE BOOK for Spare Parts Supply", published separately.
 3. The numbers in item column correspond to the same numbers in drawing.
